

Clinical Case Study #1

- Mr. Dominguez is a 65 year old Black Hispanic male. He is a retired electrical engineer. He was diagnosed with GC and Syphilis (presenting with an oral chancre) 3 months ago and denies sexual activity with men. Mr. Dominguez returns to the clinic for follow-up and a refill on his ED and topical testosterone medication. He has never been married and has no children. His twin brother died last year secondary to a MI. He is very close with his nieces and nephews and their children. His girlfriend is 50 years old nurse. He admits to an emotional monogamous relationship, but states he has regular sexually active with younger women because he respects his girlfriend too much to ask her to participate in certain sexual activities.

Clinical Case Study #1
